**RE: Endorsement of CEMATRIX (Canada) Inc for Insulating Applications**

This letter is written as a testimonial from JVC Group Ltd regarding the use of CEMATRIX CMI-475 Cellular Concrete for insulation on Plains Midstream facility in Fort Saskatchewan, AB.

Concrete trenches were constructed in 2016 with CEMATRIX CMI-475 underlying them to provide support and thermal insulation. Following the success of the first installation, CEMATRIX CMI-475 was used again in 2024 when additional trenches were added. For both projects, CEMATRIX completed geothermal modeling and provided optimized project-specific insulation design recommendations.

CEMATRIX provided a detailed pour plan and was very accommodating to several unavoidable schedule changes and delays, including splitting the scope of work into two separate mobilizations. Additional geothermal modeling was completed on short notice between the mobilizations. This joint effort allowed for the successful completion of this project on time.

The cellular concrete placed met the design requirements for density and strength. Due to the geometry of the new pour relative to the original pour, existing cellular concrete had to be excavated which was easily performed with standard equipment.

I found the CEMATRIX team very knowledgeable and professional, and they worked in a safe and efficient manner.

Based on the above information, I am willing to discuss JVC Group Ltd experience with any interested clients contemplating the use of cellular concrete from an operational standpoint. I can be reached at Rob (at) jvcltd.ca

Sincerely,

Rob Ferretti  
Operations Manager  
JVC Group Ltd.
